

Software Requirements Specification

Project: Rameshwar Imitation Management System

Document Version: 1.0.0 | Date: May 2026 | Prepared by: AI Assistant

1. Executive Summary

The **Rameshwar Imitation (RI) Management System** is a comprehensive digital solution designed to modernize the operations of an imitation jewelry manufacturing business. It replaces traditional paper-based tracking with a real-time, cloud-connected platform that handles inventory, production, sales, and employee management.

2. User Roles

Admin (Owner/Manager)

- **Complete Oversight:** Access to all financial records and inventory data.
- **Resource Management:** Add, edit, or delete items from the product catalog.
- **HR & Payroll:** Manage employee profiles, set salaries, and process advance requests.
- **Order Fulfillment:** Oversee customer orders from creation to final delivery.

Employee

- **Workflow Tracking:** View assigned production tasks and low-stock alerts.

- **Data Entry:** Record daily sales and purchases handled at the counter.
- **Self-Service:** Track personal salary history and submit advance requests for approval.
- **Production Updates:** Mark stages (Casting, Plating, etc.) as complete in real-time.

3. Core System Features

Inventory & Production

Automatic stock tracking with 4-stage production monitoring (Casting, Finishing, Plating, Packaging). Includes automated "Low Stock" visual cues and percentage-based completion tracking.

Order & Sales Integration

End-to-end order lifecycle management. Includes "Smart Dispatch" logic that automatically reconciles inventory and generates transaction records upon order completion.

Financial Ledger

Professional transaction history for all Buy/Sell activities. Supports multiple payment methods (UPI, Cash, Bank) and provides instant, printable business invoices.

IN Multi-Language Capability

Native support for **English** and **Gujarati** languages, ensuring ease of use for all staff members regardless of language preference.

4. Technical Stack

MongoDB Atlas (Cloud DB)

Express.js

React.js

Node.js

The system utilizes a **MERN** architecture with a cloud-first approach, ensuring data persistence and accessibility from any device.

5. Data Integrity

- **Automatic Seeding:** Ensures the database is never empty on first launch.
- **Robust Connection Logic:** Backend includes retry mechanisms for cloud connectivity.
- **Validation:** Prevents inventory overselling and duplicate data entry.
